

REC'D 19 AUG 2003

WIPO PCT

P1 1051779

THE UNITED STATES OF AMERICA

TO ALL TO WHOM THESE PRESENTS SHALL COME:

UNITED STATES DEPARTMENT OF COMMERCE
United States Patent and Trademark Office

August 12, 2003

THIS IS TO CERTIFY THAT ANNEXED HERETO IS A TRUE COPY FROM
THE RECORDS OF THE UNITED STATES PATENT AND TRADEMARK
OFFICE OF THOSE PAPERS OF THE BELOW IDENTIFIED PATENT
APPLICATION THAT MET THE REQUIREMENTS TO BE GRANTED A
FILING DATE.

APPLICATION NUMBER: 60/395,042

FILING DATE: July 11, 2002

RELATED PCT APPLICATION NUMBER: PCT/US03/21058

By Authority of the
COMMISSIONER OF PATENTS AND TRADEMARKS

L. Edelen

L. EDELEN
Certifying Officer

USE ONLY FOR FILING A PROVISIONAL APPLICATION FOR PATENT

This collection of information is required by 37 CFR 1.51. The information is used by the public to file (and by the PTO to process) a provisional application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 8 hours to complete, including gathering, preparing, and submitting the complete provisional application to the PTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, Washington, D.C. 20231. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Box Provisional Application, Assistant Commissioner for Patents, Washington, D.C. 20231.

APPLICATION LEVEL GATEWAY AND RULESET DOWNLOAD VALIDATION

It is important to validate that an Application Level Gateway (ALG) or Firewall Ruleset is compatible with a modem or similar device prior to its execution or use on that device. Failure to do so can cause the unit to crash or hang if an attempt is made to use an incompatible ALG or Ruleset. Compatibility must be certain with not only the device hardware, but also the device software and general configuration.

Field upgradeable products are becoming more prevalent in the market today. Devices can have ALGs and/or Firewall Rulesets downloaded remotely to them while in the customer's home. This feature places the unit at higher risk to an invalid ALG or Ruleset download since the failure mechanism caused by an invalid ALG or Ruleset may place the device in a non-remote manageable state. This can result in having to recall the unit for repair.

The invention is a method for validating the compatibility of an ALG or Firewall Ruleset on a receiving device prior to its use. If the validation algorithm indicates the ALG or Ruleset is not compatible with the hardware or software configuration of a device, it can be safely rejected. This will prevent a possible non-recoverable error condition which might exist if an attempt is made to use a non-compatible ALG or Ruleset.

The algorithm consists of attaching or otherwise embedding in a predictable location on the ALG or Ruleset information regarding the hardware family, software version range and general product configuration with which this ALG or Ruleset is compatible. This can be done by means of attaching a header or trailer on the ALG or Ruleset file. From this point on this compatibility data will be referred to as the *header*.

Specifically the algorithm validates the following parameters associated with the ALG or Firewall Ruleset:

- Information Version
- Size
- CRC
- Signature
- Compatible Hardware Version Family
- Compatible Software Version Family

The discrimination items above are discussed in the paragraphs below.

The first item to validate is a version number of the information describing the ALG or Firewall Ruleset file. If the software performing this discrimination is not familiar with this format of information, it may look in the incorrect location for key information or misinterpret

information in the ALG or Ruleset's header. If the Information Version is not known by the discrimination algorithm, the ALG or Ruleset must be rejected.

If the ALG or Firewall Ruleset is too large to store in memory (typically non-volatile), it must be rejected as non-compatible. Failure to do this might result in a truncated file or a overrun into memory not allocated for its storage.

Next, a Cyclic Redundancy Check (CRC) is performed on the header information so as to validate the information is correct. This is done after the length and version are examined so as to insure the CRC value and the length over which the CRC is performed are correct. Although the probability of finding a valid CRC in an incorrect location in the header or by performing the CRC algorithm over an incorrect length is remote, this is considered more prudent. If the CRC fails, the ALG or Firewall Ruleset must be rejected.

If a cryptography signature is present in the file, it must now be validated. This will insure the ALG or Firewall Ruleset file is from a trusted source. If the source of the ALG or Ruleset cannot be validated, it must be rejected.

Next the ALG or Ruleset header should contain a list or range of compatible hardware version(s). If upon examination the hardware version of the device on which the ALG or Ruleset is to be executed is not within this range/list, it must be rejected.

Finally the ALG or Ruleset header should contain a list or range of compatible software version(s). If upon examination the software version of the device on which the ALG or Ruleset is to be executed is not within this range/list, it must be rejected.

Additional discriminations can be interspersed into the above as necessary. If all discriminations accept the ALG or Ruleset, it may be used on the device without risk. This is contingent on the validity of the information in its header.

Figure 1 is a block diagram of a cable modem including a BCM3345 Cable Modem integrated circuit processor, suitable for employing the method of the invention.

Figure 2 shows the cable modem of Figure 1 connected to the Internet, to a home network including multiple PCs via an Ethernet port, and to an individual PC via a USB port.
